

ABSTRACT OF THE DISCLOSURE

A parametric audio system having increased bandwidth for generating airborne audio signals with reduced distortion. The parametric audio system includes a
5 modulator for modulating an ultrasonic carrier signal with a processed audio signal, a driver amplifier for amplifying the modulated carrier signal, and an array of acoustic transducers for projecting the modulated and amplified
10 carrier signal through the air along a selected projection path to regenerate the audio signal. Each of the acoustic transducers in the array is a membrane-type transducer. Further, the acoustic transducer array is a phased array capable of electronically steering, focusing, or shaping one or more audio beams.
